

# Create our Models

- Remember data should live in a model. The design does not care about where we store this.
- We will use an Array to store out todo-list. So yeah, its a simple model. An array.
- Later on we can create more complicated models - but for our purpose this is fine.
- We will store out todo items in an array. reminder of array:

```
items = ['Go to the gym', 'Visit Grandma', 'Do laundry', 'Dont forget to chill!']
```
