

Lets Begin to write Code!!!

What is a Variable

A variable is a location in memory that holds data. Usually you assign a value to a variable that can be used later.

A variable is just a holder. The value in a variable can change. Hence it is known as a variable.

```
your_name = 'radhika' //LHS is the variable. RHS is the data
your_name = 'bumlebee'
print(your_name) //will now print bumlebee because thats the last thing the variable was assi
```

Swift also has constants. A constant is a variable that cannot be modified. More on that soon.
